The Morality of Food

Somewhere along the way, eating acquired a conscience. Foods became good or bad, clean or dirty; a slice of cake stopped being dessert and became a confession. And an entire industry grew up around managing the guilt it had first manufactured: a diet for every deadly sin.

The strange result is that we now know more about nutrition than any generation in history and feel worse about eating than any of them. Knowledge was never the missing piece. A cease-fire was.

This book proposes one question to replace the moral audit: how do you want to feel at four in the afternoon? Not thinner, not virtuous. Functional. Awake. Even. When energy becomes the metric, food gets simpler almost immediately, because your body starts giving you data instead of verdicts.

We will build the system slowly: a handful of default meals, a grocery rhythm, one month of small experiments. By the end, food should take up less space in your head, which, you may discover, was the goal all along.

Energy First

Track nothing except how you feel two hours after eating. That is the entire diagnostic method of this book, and it outperforms most apps because it measures the only output you actually care about.

This chapter explains the physiology just deeply enough to be useful: why the enormous lunch mugs you, why the pastry breakfast writes a cheque the afternoon has to cash. It then turns this into a simple plate pattern you can apply anywhere food is served.

No arithmetic. No scanning barcodes. Just a working model of your own machinery, refined by attention.

Default Meals

Decision fatigue, not appetite, is what breaks most eating intentions. This chapter builds your set of default meals: five breakfasts, five lunches, five dinners you genuinely like. It shows how defaults free you to be adventurous when it's worth it.

Later chapters handle groceries, restaurants, protein without obsession, and the experiment month that tunes the whole system to your body.
