Terra Incognita: The Default Audit

Ask someone to describe their day and they will narrate their decisions: chose the salad, called the client, went to the gym. Watch the same day on film and you will see something else: a river of unchosen movements, hundreds of them, flowing around a handful of actual choices like water around stones. The phone lifted forty-one times, not once deliberately. The route walked identically. The snack eaten in the same chair, at the same minute, with the same absence of anyone deciding anything.

None of this is failure. Defaults are the mind's compression algorithm; without them you could not survive a supermarket. But here is the cartographer's question this book turns on: who drew your map? Some defaults you laid down deliberately, years ago, for reasons that still hold. Others were drawn by app designers, supermarket planners, old flatmates, and a version of you that no longer exists, and you are still walking their routes daily, in your own life, like a tenant.

The default audit is how we begin. For two ordinary days you will do nothing differently. You will only notice, and note, the moments where behaviour happened without a decision. Readers consistently report the same reaction, somewhere around the thirtieth entry: I had no idea anyone was driving.

Then, territory by territory, we take the pen back.

Placement Theory

The most reliable finding in behaviour research is embarrassingly physical: distance changes behaviour more than desire does. Fruit at eye level gets eaten. The guitar in the case stays in the case. Your environment is a ballot, and every placement is a vote cast daily on your behalf.

This chapter turns placement into a method: the thirty-second rule, sight-line design, the one-move principle. It then applies these to the objects that currently place you.

*Here ends the open preview. The complete edition arrives
the moment you purchase it at zokario.com, every
chapter of it, with lifetime online reading.*
